APPLICANT(S) FOR DO/EO/US

Hakki Riza KAMMAN

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (21) indicated below.
4. The US has been elected by the expiration of 19 months from the priority date (Article 31).
5. A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. is attached hereto (required only if not communicated by the International Bureau).
 - b. has been communicated by the International Bureau.
 - c. is not required, as the application was filed in the United States Receiving Office (RO/US).
6. An English language translation of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. is attached hereto.
 - b. has been previously submitted under 35 U.S.C. 154(d)(4).
7. Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))
 - a. are attached hereto (required only if not communicated by the International Bureau).
 - b. have been communicated by the International Bureau.
 - c. have not been made; however, the time limit for making such amendments has NOT expired.
 - d. have not been made and will not be made.
8. An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)). (UNEXECUTED)
10. An English language translation of the annexes of the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11 to 20 below concern document(s) or information included:

11. An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. A **FIRST** preliminary amendment.
14. A **SECOND** or **SUBSEQUENT** preliminary amendment.
15. A substitute specification.
16. A change of power of attorney and/or address letter.
17. A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825.
18. A second copy of the published international application under 35 U.S.C. 154(d)(4).
19. A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4).
20. Other items or information:

EXPRESS MAIL CERTIFICATE

AUTOMATIC SYSTEMS AND METHODS FOR INCLUDING CUSTOMS TARIFFS IN E-COMMERCE TRANSACTIONS

This is a continuation-in-part of U.S. Patent Application Serial Number 09/409,003, filed September 29, 1999, now pending, which is hereby incorporated by reference as if set forth in its entirety herein.

FIELD OF THE INVENTION

The present invention relates to systems and methods for facilitating international electronic commerce transactions, and more particularly relates to systems and methods which compute the relevant tariffs and provide suitable documentation in support of international commerce.

BACKGROUND

With the proliferation of electronic commerce transactions through distributed networks such as the Internet, merchandisers and service providers alike have enjoyed a far-reaching and greatly expanded customer base to which they can sell their wares and services. An obstacle remains, however, for international commercial transactions for which customs tariffs are due and for which documentation is required in order to ship the purchased items into the destination country.

The customs laws of many countries exclude from customs duties limited quantity purchases on the grounds that such purchases are personal in character rather than commercial. To avoid the complexities introduced by international customs requirements, many online merchandisers have exploited this exclusion by restricting their customers' ability to purchase more than a limited number of items at one time. For example, the Internet bookseller Amazon.com

-2-

restricts its international customers to purchasing at most three books in a single transaction to avoid customs duties and related paperwork. Such online merchandisers have carved a path to avoid the complexities of customers tariffs, but at the same time have frustrated international commerce by requiring customers to make 5 discrete purchases and pay the shipping and handling costs for separate, smaller shipments. Moreover, the additional shipping and handling costs can far exceed the customs duties that would otherwise would be owing on a single transaction. One can only speculate as to the scope of the effect this practice has had on the evolution of international electronic commerce transactions through the Internet.

10 What is needed in the art and has heretofore not been available is a system and method for facilitating international electronic commerce transactions. What is further needed in the art and has heretofore not been available is such a system which automatically includes appropriate customs tariffs in an electronic commerce transaction. A further benefit would be such a system which further 15 generates the appropriate paperwork so that the international electronic commerce transaction can be delivered to a customer with minimal, if any, delay. The present invention satisfies these and other needs.

SUMMARY OF THE INVENTION

20 The invention provides systems and methods for facilitating international electronic commerce through a distributed computer network such as the Internet. The method includes the steps of obtaining purchase transaction details concerning one or more items that are to be purchased, processing at least a portion of the purchase transaction details to determine the tariff due for shipping each such item 25 to a particular destination, and reporting the tariff due through the distributed computer network. The system and method of the invention utilizes artificial intelligence in the determination of the minimum applicable tariff rate that is to be applied to a particular item purchase for a selected destination.

30 The purchase transaction details are processed, in accordance with one aspect of the invention, to select a harmonized code for shipping the item to a

-3-

prescribed destination at a minimum applicable tariff rate. A tariff due is then determinable by applying the processed harmonized code. At least a portion of the purchase transaction details are analyzed in the selection of a harmonized code for shipping the item to a particular destination instead of simply looking-up a broad-
5 category tariff rate.

In one particularly preferred arrangement, the selecting or processing step includes searching through a tariff schedule of the particular destination and identifying a harmonized code that best fits item descriptors included in the purchase transaction details.

10 In accordance with a more particular and preferred embodiment, the method includes the further steps of generating an invoice, an airway bill and a packing list from the purchase transaction details and providing same through the distributed computer network. Optionally, the tariff due can be reported in the local currency of the selected destination and/or in multiple currencies such in both the
15 local currency of the selected destination and in United States currency.

Further aspects and features of the present invention can be appreciated from the appended Figures and accompanying written description.

BRIEF DESCRIPTION OF THE DRAWINGS

20 Fig. 1 illustrates the home page of a fictitious Web site, "XYZ Online;"
Fig. 2 illustrates an item-selection page of the Web site of Fig. 1;

25 Fig. 19 is a shipment airway bill for the purchase transaction that also is prepared and forwarded to customs in accordance with the second feature of the present invention; and

Fig. 20 is a packing list for listing the items being shipped which is also prepared and forwarded to customs in accordance with the second feature of the present invention.

-5-

DETAILED DESCRIPTION OF A PREFERRED EMBODIMENT

By way of overview and introduction, the present invention is described in connection with a purchase transaction through a United States based Web site, namely, XYZ Online. The invention has application in other contexts, 5 including as a resource for reference by one business for a transaction with another business, by an individual for the individual's edification, and in other applications as described hereinbelow. The invention facilitates international electronic commerce by automatically determining the applicable customs duties and any value added taxes that may be owing as a result of a purchase from an entity in one country for delivery 10 to a person or entity in another country.

Referring now to Figure 1, a home page 100 of XYZ Online is illustrated within the display of a conventional browser 110. The browser 110 includes navigation buttons to move forwards and backwards among various Web pages and provides further functionality including secure transmission of documents 15 over the Internet or other distributed computer network, for example between the browser (at the client side) and a web server, such as the server hosting the XYZ Online website. The details of the browser 110 are conventional and from no part of the present invention.

With further reference to Fig. 1, the web page 100 includes information 20 provided by the Web site XYZ Online such as a description of the goods and services that are available for purchase by the customer. By navigating through the pages of the XYZ Online Web site, a user can view and select various items for purchase. For example, by selecting the Men's Campus Shop button 120 causes an item-selection page 200 to be displayed on the web browser 110. For ease of illustration, the active 25 window is displayed in Figs. 2-14 separate from the web browser 110; however, it should be understood that these Figures depict the presently active window of the web browser 110.

With reference now to Fig. 2, the item-selection page 200 is displayed 30 as the active window in the web browser 110 (not shown). The item-selection page 200 provides details on a particular item that is available for selection at the XYZ

-6-

Online website. In particular, that page describes a vest which is available for \$29.50 United States Dollars ("USD") in various colors and sizes as indicated at 210-230, respectively. An item description includes further details about the construction of the vest, the fabric from which it is made, and the manner in which it may be washed, at 5 indicated at 240. A series of selection lists enable the user to select a color, size, quantity of the item and to provide information as to whom the item is to be shipped. The selection lists illustrate a set of choices made by the user including a color (e.g. navy) entered in selection list 250, a size (e.g., medium) in the selection list 260, and a quantity (e.g., 1 unit) in selection list 270. The ship-to selection list 280 is described 10 in connection with Fig. 3 below. The page 200 further includes an "add to bag" button 290 which metaphorically signifies a desire to purchase the item.

With reference now to Figs. 2 and 3, the XYZ Online website may or may not know the identity of the individual entering the transaction at this stage. If the person's identity is known, then the ship to selection list box 280 can include a 15 meaningful choice of persons to whom the item can be shipped to (e.g., to the user himself, to friends or relatives of the user, etc.). If, however, the identity of the user is not yet known to the system, then the only choice in box 280 will be "other," which causes a further Web page 300 to be displayed to the user so that the identity of the person to whom the item is to be shipped can be entered. The Web page 300 20 preferably is a new page loaded for the purpose of providing the user with a text box 310 for entering the name of the person to whom the item is to be shipped. Upon pressing the continue button 320, the Web page 310 can be unloaded or closed, and the information provided in the text box 310 is automatically included in the field 280 of the item-selection Web page 200. Alternatively, the user can provide the ship-to 25 information in a text-box within the form of the item-selection page 200.

When the item-selection data form is complete, the customer uses the "add to bag" button 290 to either continue shopping or purchase the selected item. Preferably, a client-side script or applet ensures that all required fields 250-280 of the 30 form have been completed prior to posting the form to the server of the XYZ Online Web site.

-7-

These forms, and others used in the system preferably are implemented using standard hypertext markup language (HTML). For example, the selection list for selecting a color in the item-selection page 200 can be defined using pseudocode as shown below.

5 <select name="colors">
 <option value="navy"> navy
 <option value="black"> black
 <option value="oat"> oat
 <option value="green_mountain"> green mountain
10 <option value="pumpkin"> pumpkin
 <option value="orange"> orange
 <option value="charcoal heather"> charcoal heather
 </select>

15 Also, the simple text entry fields can be implemented using the HTML singleton tag for an input, as shown below within the cell of a table.

15 <table>
 <tr>
 <td><input type="text name=colors size=25></td>
20 </tr>
 </table>

In the event that the customer continues to shop, additional item-selection pages such as the Web page 400 can be displayed through the Web browser
25 110. The manner of displaying items for selection is not material to the present invention. For purposes of illustration, the Web page 400 displays an "original sweatshirt" which is available for selection at the XYZ Online Web site. The "original sweatshirt" costs \$24.50 USD, and is available in various colors and sizes, as indicated at 410-430, respectively. Addition descriptive detail is provided at 440 to
30 inform the customer and attract the customer's interest. That description includes the material from which the sweatshirt is made, the style of the cut ("crewneck") and laundering information. As described above in connection with the Web page 200, the color, size, quantity and ship to information are entered using selection lists 450-

-8-

480. If the customer has already identified a person to ship the item to by entering
data into the text box 310 of Fig. 3 or by selecting a person in the ship-to selection list
280, then the selection list 480 may include such person by default. The sweatshirt is
added to a (growing) list of selected items using the add-to-bag button 490. On the
5 other hand, the user can cancel the selection using the continue button 492.

Upon pressing the add-to-bag button 490, a bag-contents Web page
500 is called up as the active window. The bag-contents Web page itemizes the user's
item selections, arranged by the person to whom the items are to be shipped. For
example, the user who completed the forms of Figs. 2-4 elected to ship the selected
10 items to "Ms. Phyllis J. Bala." Those items include the "Pro Fleece Vest," as
indicated in row 510 and the "Original Sweatshirt," as indicated in row 520. The size,
color choice, and quantity, as well as the price for each item are indicated in the
respective rows of the bag-contents Web page 500. From this Web page, the
customer is prompted to either change his or her order, remove an item from the
15 order, or continue shopping. An order can be changed by selecting the item by name.
For example, the data within the "item name" column can be selected to return to the
item-selection Web page for that item. Thus, for example, a user selecting the "Pro
Fleece Vest" using the hyperlink 530 is returned to the Web page 200 and the user
selecting "original sweatshirt" using the hyperlink 540 is returned to the item-
20 selection Web page 400. Items can be removed from the shopping bag using remove
buttons 550, as illustrated. The remove buttons delete the item from the list of items
to be purchased by that user. From the shopping-bag page, therefore, users can update
their shopping bags (button 560), purchase the selected items ("checkout;" button
570), or continue shopping (button 580). Optionally, the data can be changed from
25 this page as well (such as the size, color, quantity) by selecting one of those entries and
changing its value. For example, the user can change their selection of a medium size
sweatshirt to a large one by selecting the size data cell in row 530 and entering in a
different value. Preferably, a client-side script or applet tests such manually entered
changes to make sure that the value entered conforms with the set of valid values for
30 the selected item. If the customer is done shopping, the checkout button will call a

-9-

further web page such as the web page 600. On the other hand, if the customer wishes to continue shopping and call up other item selection web pages, then he or she uses the continue button 580.

When the customer is done shopping and wishes to checkout, a Web page such as Web page 600 is called up on the web browser 110. The Web page 600 provides the customer with checkout options including the ability to checkout online, in accordance with a preferred mode of the invention, and to place the order in another manner, for example, by telephone. Preferably, the customer can go back to a prior web page using a back button 630 if the customer is not ready to checkout.

In the event that the customer uses the online checkout button 610 to complete the order, then further Web pages are called up on to the customer's Web browser to obtain billing, shipping and payment information.

With reference now to Fig. 7, the customer proceeds to checkout by completing standard fields in a billing-information form 700. Various fields are provided for entering the customer's name (field 710), address (field 720), city, state/country, and zip code (fields 730-750, respectively). Other information can be solicited for order confirmation purposes such as a daytime phone number (field 760) and an e-mail address (field 770). Upon completing the billing information form 700, the customer presses a continue button 780 to call up a shipping-information form in window 800. The person to ship the items to ship to is known by the system from the data that was entered into text box 310 (see Fig. 3). Preferably, a client-side script tests whether the ship to name is the same or similar to the name in the billing information field 710, and, if so, fields 810-860 are populated with the information from fields 710-760, respectively. Otherwise, the customer must complete the ship-to information so that the system knows the complete mailing address and daytime phone number of the recipient. Optionally, a series of radio buttons 870 can be provided to provide a selection of gift packaging, unassembled gift boxes, or a gift-boxing service at an additional expense. Once the information in the ship-to window 800 has been completed, the customer proceeds further toward completing the transaction by pressing the continue button 880.

-10-

The method for shipping is selected by the customer in window 900. For domestic shipments, the customer has a choice among several services; however, the system preferably determines from the information provided in the shipping information form 800 that the destination is an international address and presets the 5 international shipping method as the default choice (see radio button 910). The customer completes the purchase transaction by pressing the continue button 920 and advancing to the payment-information Web page 1100. Optionally, the system can then present a window such as window 1000 in which the customer is apprized of the cost for shipping the selected goods. The customer then continues using the button 10 1010, or goes back, to a prior screening hitting the button 1020.

With reference now to Fig. 11, a payment-information form is illustrated in window 1100. The payment form includes standard fields for inputting the account to be charged (for example, using the radio buttons 1110), fields for entering in the expiration date 1120 and the credit card number 1130, and a series of 15 fields 1140 for identifying the name, address and contact information of the card holder. Preferably, the fields 1140 are populated with data obtained from the billing-information form 700, in a conventional matter.

Once the payment method form has been completed, the purchase transaction is posted to XYZ Online (or whichever Web site the customer is 20 interacting with) using submit button 1150. As described above, a client-side script or applet can be used to verify that all required fields and information have been provided by the customer.

The shopping-bag model described herein is one method for acquiring purchase transaction details which are processed in way which selects a harmonized 25 code for shipping the item to a prescribed destination at a minimum applicable tariff rate; howevr, other models can be used for placing purchase orders such as the one-click model described in U.S. Patent No. 5,960,411 of Hartman et al., assigned to Amazon.com, which is hereby incorporated by reference as if set forth in its entirety herein.

30 In accordance with one feature of the present invention, the customs

-11-

duty and any value added tax that is owing for the items selected for purchase are computed automatically.

With reference now to Fig. 12, because the items are to be delivered from the United States (from XYZ Online) to Great Britain, the total cost of the purchase transaction includes both customs duties and a value-added tax. The rate of customs duties varies from country to country, as does the applicability and rate of value added taxes ("VAT"). The total cost for the items in the shopping bag, therefore, includes both of these items, but is a difficult quantity for many retailers to compute reliably.

In accordance with the invention, however, the XYZ Online Web site has access to a tariff server, described below, which processes portions of the purchase transaction details to determine the tariff due for shipping the selected items to the destination input by the customer. The page 1200 displays the total transaction cost using information provided by the tariff server. It should be understood, however, that the functionality of the tariff server can be incorporated at the XYZ Web site; the tariff-processing routines can be local or remote so long as it is in communication with other computers that request its service.

Thus, in addition to the value and freight charges for the selected items which are known to the XYZ Web site, a customs duty column 1210 and a value added tax column 1220 provide the customer with further information concerning the amount of the duty and/or VAT that are associated with each selected item. In addition, the total cost of each item in the local currency is initiated in column 1230 as a further feature for the customer's benefit. As illustrated, the customs duty due for one "Pro Fleece Vest," in the currency of Great Britain, where the item is to be shipped is £3.45, a 13% customs duty. In addition, there is a VAT due on this item in the amount of £2.55. For the selected sweatshirt, the customs duty is 15% and amounts to £3.51. The VAT for the sweatshirt £2.28. The total-cost window 1200 includes a hyperlink 1240 to see the details behind the calculations presented in the window 1200.

Referring now to Fig. 13, the details of the customs duty and VAT

-12-

calculations are shown in the window 1300. The computations for each item that was selected are shown separate columns. In column 1310, the details for the "Pro Fleece Vest" are illustrated. Those details include the harmonized tariff that was used to compute the customs duty at line 1330, the applicable customs duty/tax at line 1340, 5 the value added tax at line 1350, the conversion rate into the local currency of the cost-of-goods plus freight at 1360, and the amount of the customs duty and VAT due for such item, shown at line 1370 and totaled at line 1380. In like manner, the details for the selected "original sweatshirt" are specified, and the cost for all of the selected items is provided in the local currency (pounds) at line 1390 and in U.S. dollars at line 10 1392.

If the customer accepts the total cost and submits the purchases using the submit button 1150, the system preferably responds with an online receipt, such as shown in Fig. 14. The online receipt 1400 summarizes the information provided by the customer throughout the course of the online shopping experience. Specifically, 15 the shipper, bill-to and ship-to information are summarized at the top of the receipt, the items purchased, their quantity, value, freight, customs duty and any applicable VAT are also specified along with total cost for each item and the total cost of the overall purchase transaction. (At least a portion of these "purchase transaction details" are provided as item descriptors to the tariff server for computing the 20 applicable customs duty and VAT, if any.) In addition, the customer is preferably provided information which assists order tracking, including an invoice number 1410, an invoice date 1420, an order number 1430, an order date 1440, an airway bill ("AWB") tracking number 1450, and a reminder 1460 of the type of payment that was 25 used to complete the purchase transaction. The customer can print the contents of the receipt by selecting the text 1470 and can continue to shop and explore the XYZ Online Web site using the button 1480.

With reference now to Figs. 15 and 16, the steps that are taken in order 30 to determine the customs duty and VAT that may be owing for a given purchase transaction are described in connection with a standard network configuration in which a client-side browser 110 accesses an e-commerce enabled Web site 1630

-13-

through a standard connection to the Internet 1620. The determination of such duties and taxes start at step 1500, either by invoking a routine running at a host Web site such as XYZ Online or by linking to (addressing) a tariff server 1610 which has been configured to perform the steps of Fig. 15 and return the customs duty and value-added tax amount.

In the preferred embodiment, the steps of Fig 15 are implemented by a tariff/VAT server 1610. Upon confirming a purchase transaction which is to be shipped internationally, the Website 1630 preferably conveys purchase transaction details ("PTD") to the tariff VAT server 1610 for processing. In turn, the tariff/VAT server provides the Website 1630 with the customs duty owed and any VAT that might be due for the proposed purchase transaction. The tariff/VAT server 1610 preferably is a stand-alone server that can be accessed by a plurality of Websites 1630 or by customers through their own browsers 110. However, in the present discussion, the functionality and determinations made by the tariff/VAT server 1610 are accessed by the Website 1630 to apprise the customer of the customs duty and VAT owing for the proposed purchase transaction.

At step 1510, the server 1610 obtains item selections made by the customer from the Website 1630. A test is made at step 1520 to determine whether the harmonized code for the selected item is known to the system either with the item description or through a uniform product code (UPC) which is correlative to the Harmonized Codes. The harmonized code can be provided by the Web site 1630, but more typically only will be known to tariff server if the duty owing on that same item previously had been determined and is available to be provided from a data store at step 1530. In the event that the harmonized code is known, however, the tariff readily can be computed. On the other hand, if the harmonized code is not known, then further steps are required to identify the appropriate harmonized code for the selected item, as discussed next.

At step 1540, the item description provided by the Web site 1630 (or by a customer through the client side browser 110) is converted into a possible search phrase so that at least a portion of the purchase transaction details is in a condition for

-14-

processing so that a harmonized code can be selected and a minimum applicable tariff rate can be determined. Preferably, a translator program is applied to the item description so that all searches of the Harmonic Tariff Schedule ("HTS") database are in one language. Preferably, the translator program converts all item descriptions into English, if not in English already. A rule base 1544 then operates on the item description in the prescribed language (e.g., English), using a dictionary to filter out words which do not appear in the HTS and a translator to convert words in an item description into a similar word defined in the HTS (e.g., "sweatshirt" can be converted to "jersey").

10 At step 1546, the resulting searchable phrase is sorted into an ordered arrangement suitable for parsing the HTS data base. The searchable phrase is arranged into an order suitable for parsing the hierarchical structure of a Harmonized Tariff Schedule. The ordered arrangement is formulated to be an intelligent search query for searching the Harmonized Schedule database at step 1548. As understood by those of skill in the art, the HTS is arranged in a hierarchical manner from general to specific within each of several categories. Thus, for example, textiles are arranged at a first level in terms of the type of product (for example, men's or boys' shirts, women's or girls' dress, etc.), at a second level in terms of the material (e.g., polyester, fine animal hair, etc.), and at a further level in terms of the weight of the material (e.g., how heavy the textile is). A particular item description provided to the tariff server 1610 by a given Web site 1630 may not specify all levels of detail required to make a final determination of the most appropriate harmonized code to use. Using the information provided, however, the HTS data-based is searched at step 1548 using the ordered search phrase from the item description.

25 For example, the original selected shirt is described in the window 400 as a "relaxed fit. crewneck. embroidered "XYZ original" logo at chest. 90% cotton/10% polyester, enzyme sandwashed for softness. machine wash." This information (field 440) is converted into a partial search phase at step 1540 using the rule base 1544. No translation is required because the description is in English. The 30 rule base extracts from the item description the terms "crewneck" "90% cotton" and

-15-

"10% polyester" and the term "sweatshirt" from the page title. The term "crewneck" is converted using the rule base into a term which appears in the HTS, namely, into the term "jersey." The garment descriptor "jersey" is a first level search criteria.

Fig. 17 illustrates a portion of the harmonized code ("HC") for Great Britain. The HC 6110 concerns "jerseys, pullover, cardigans, waist coats and similar articles, knitted or crocheted." The first level search criteria "jersey" identifies this harmonized code as being the relevant harmonized code. The search term "90% cotton" provides the second level criteria for selecting the appropriate subheading and a more specific HC. As can be seen from reviewing Fig. 17, the harmonized code 10 6110 is divided into several different material types including "of wool or fine animal hair" (line 5) and "of cotton" (at line 12). The "original sweatshirt" is not made of wool or fine animal hair and so the system continues to search through its HTS database until it arrives at line 12, "of cotton." In the "of cotton" category, there are different tariff rates available, depending on the specifics of the particular garment in 15 question. Thus, the rate can be 12% (line 13) or 15% (line 17) depending on the particulars of the garment. The item description provided for the "original sweatshirt" does not clarify whether it is a lightweight fine knit polo or turtleneck jumper or pullover as required to obtain the 12% tariff. Therefore, the tariff server 1610 searches for higher-number subheadings within the 6110 heading and arrives at code 20 61102091, "other: men's or boys." The tariff for that classification is 15%, as indicated at 1710.

Referring again to Fig. 15, the tariff server 1610 searches the HTS database using the search phrase from step 154, which was extracted from the purchase transaction details, in an effort to locate the most detailed HC classification 25 within a category to ensure that the correct and lowest applicable tariff is applied, as indicated at step 1550. When a subheading specific to the selected item cannot be located, the system defaults to an "other" subheading. Once a HC is identified, it is selected for use in computing the tariff that is due, as described below. In addition, the tariff server 1610 stores this new knowledge at step 1552 along with the item 30 description (name and material), its size and weight (if specified), and the source (e.g.,

-16-

XYZ Online). Such information can be provided at step 1530 to inform the test made at step 1520 and avoid the need to perform steps 1540-1552 thereafter. Thus, in the event that the tariff server 1610 is later requested to determine the tariff and any VAT due on the same item from the same source, the HC would be known to the tariff server 1610 and can be applied at step 1564 below to compute the tariff due.

Consequently, the software of the tariff/VAT server 1610 uses artificial intelligence programming to formulate intelligent search queries for searching a Harmonized Schedule database and making informed tariff/VAT determinations. In addition, the software of the tariff/VAT server learns from each proposed purchase transaction by storing information concerning any selection of harmonized tariff codes and determinations as to minimum applicable tariff rates to assist future analyses, evaluations, and tariff/VAT determinations.

The tariff computation is typically based upon either the cost-of-goods plus freight (C&F), or the cost-of-goods plus insurance plus freight (CIF). At step 1560, the cost of goods plus shipping is added together to define the basis for tariff and VAT calculations. This step can be done at the Web site 1630 instead of at the tariff server; however, because the basis for tariff calculations varies from country to country, it is greatly preferred to provide the cost of each item being purchased, the total shipping cost and any insurance as separate values to the tariff server 1610.

When multiple items are being purchased in a single transaction, the rule base is accessed to determine whether and how to apportion the shipping charges among the selected items, as described in the Examples below.

The basis for computing tariffs varies with country to country, but typically is based on either the freight-on-board (FOB) cost, the cost plus insurance plus freight (CIF) or cost plus freight (C&F) basis. The software resident in the server that is configured to make the tariff/VAT determinations reviews electronic data representative of the customs laws and legislation of the destination country, that country's duty/tax, VAT and other tariff-related particulars. When computing tariffs on shipments with plural items, the treatment of freight charges under the tariff laws also can vary with the destination country and the varied treatment is implemented by

-17-

the tariff/VAT server with reference to the electronic database maintained for each destination country. The database for each destination country can be maintained at a data store and provided as needed to inform the tariff computation. For example, some countries permit freight charges to be divided among items being shipped
5 together, and other countries have a minimum established freight for a shipment to that country which must be used in the tariff computation and this disparate treatment of the same proposed purchase for two different destination countries can be accommodated by the tariff/VAT server as illustrated in the following Example.

10

Example 1: Freight Charges In Tariff Calculations

A customer selects a shirt and a pair of jeans to purchase. The shirt is \$20.00 United States Dollars ("USD") and the jeans are \$40.00 USD. The total value of the purchased items is \$60.00. At 1%, insurance adds \$0.60 USD. Total shipping charges to the customer are \$15.00 USD. Thus, before adding tariffs due, these items
15 will cost the customer \$75.60 USD on a cost-insurance-freight basis to be delivered. However, customs in the destination country imposes a tariff which must be paid and documentary requirements which must be satisfied before the items are delivered to the customer. The tariff schedule for the destination country is referenced in order to determine the additional amounts owing for shipment into the destination country. In
20 this example, CIF is the basis for the tariff computation.

A. The destination is a European Union member which permits allocation of shipping charges among the items purchased. The CIF of the shirt for tariff purposes is therefore \$27.70 (\$20.00 cost plus \$0.20 insurance plus \$7.50 freight) and the CIF of the jeans for tariff purposes is \$47.90 (\$40.00 cost plus \$0.40 insurance plus \$7.50 freight). The tariff schedule of the destination country is now referenced using the values \$27.70 and \$47.90 to determine the required tariffs for these two items.
25

30

-18-

- B. The destination is a Ukrainian country which has a minimum freight charge of \$15.00 established for each non-documentary item shipped into that country. Using this rule, the basis for tariff calculations is \$35.20 for the shirt (\$20.00 cost plus \$0.20 insurance plus \$15.00 freight) and \$55.40 for the jeans (\$40.00 cost plus \$0.40 insurance plus \$15.00 freight). The tariff schedule of the destination country is now referenced using the values \$35.20 and \$55.40 to determine the required tariffs for these two items.
-

10

Example 2: Use Of Harmonized Codes

A customer selects a lined track suit to purchase. The track suit costs \$80.00 USD and the item description identifies it as being having a gortex outer shell and a cotton lining. At 1%, insurance adds \$0.80 USD. Total shipping charges to the customer are \$20.00 USD. Thus, before adding tariffs due, the coat will cost the customer \$100.80 on a cost-insurance-freight basis.

The harmonized code ("HC") for such a product is 62113331. Using the descriptive information provided about the product (track suit at the first level criterion, gortex ("man-made fiber") as the second level criterion, and the further description "with cotton lining", the tariff server identifies the garment under heading 6211, searches down to "other garments, mens' or boy's" and down further to "man-made fibers" and finally to "track suits." As a result, the HC identified is 62113331, with a tariff of 13%.

If the search phrase did not include the term "track suits," the tariff server would have defaulted to the "other" category at line 24, selecting upper and lower parts, potentially at a higher tariff rate. However, because the search phrase was more specific, a more appropriate subheading was identified.

Example 3: Use Of Knowledge Base To Inform Harmonized Code Selection

30 A product is described at Web site 1630 as being a "cotton sweatshirt."

-19-

The customer selects the cotton sweatshirt in men's size "medium" and a request is posted by the Web site 1630 for a tariff computation by the tariff server 1610. The search phrase leads the tariff server 1610 to HC 6110, line 12, "of cotton." However, there is no basis in the information provided by the Web site 1630 for making a more detailed subheading determination (e.g., the product weight or its shipping dimensions are not specified). Thus, the search defaults to "other" and selects the tariff rate 15% indicated at 1710. However, the information from the Web site 1630 included the fact that the garment was a men's size medium. By accessing the knowledge database, the tariff server 1610 can estimate the weight of the selected item based on knowledge of the weight of similarly described items from other sources. For example, another seller of "sweatshirts" may have described a men's size medium sweatshirt as being 500 g and the tariff server 1610 can utilize this information to minimize the tariffs due by using this weight to select "lightweight pullover" as a subheading and identify the tariff amount of 12% (indicated at 1720) as being appropriate for the transaction, thereby saving the customer 3% of the tariffs that otherwise would have had to have been paid. Otherwise, the tariff server will accept the highest tariff rate or will prompt the customer (directly or through the Website 1630) for further information.

Returning to the Fig. 15, the basis for the tariff calculation is converted at step 1562 to the local currency of the destination indicated by the customer in the ship-to form 800. At step 1564, the applicable customs tariffs are applied to the tariff basis substantially as described above and in the preceding Examples, by multiplying the tariff rate in the rightmost column of Fig. 17 by the tariff basis provided to or computed by the tariff server 1610. At step 1566, the value added tax is added, if any, and is computed in a similar manner, using a VAT schedule for determining the applicable rate for the selected item. Thereafter, the total amount due can be displayed to the customer as indicated at step 1568 in a window such as window 1200 at the Web site 1630.

Another feature of the present invention is now described with reference to Figs. 18-20.

-20-

Fig. 18 is an invoice which identifies the purchased items at a level of detail required by customs offices around the world. In particular, the invoice specifies the item by name and description, its unit price, the quantity purchased, the total price of the units purchased, the freight cost, and the total for that item. In addition, the shipper and recipient are identified on the invoice. All of this information is acquired by the tariff server from the purchase transaction details provided by the Web site 1630. The tariff server includes the airway bill ("AWB") number 1930 once an AWB has been generated, described next.

Fig. 19 illustrates the AWB having the level of detail required by customs offices. The AWB includes information sufficient to ensure proper delivery of the purchased items to the intended recipient. In particular, the AWB specifies the shipper's and recipient's respective addresses, the shipment details (e.g., "international non-document", shipper to pay), a description of the items (by reference to the packing list of Fig. 20), the declared value of the goods being shipped in both U.S. and local currency (field 1910), the harmonized code (field 1930), an indication that the shipper will pay destination duties, the total cost for shipping (\$25.00), and an AWB number 1930. Apart from the data in fields 1910-1930, the information in the AWB is obtained from the purchase transaction details are acquired by the tariff server from the Web site 1630. The data in fields 1910-1930 are supplied by the tariff server.

Fig. 20 is a packing list which accompanies the AWB and specifies the shipper, the destination, the items being shipped, their quantity and description. In addition, other details are provided for tracking purposes, including the AWB number 1930. As with the invoice and AWB, all of this information is acquired by the tariff server from the purchase transaction details provided by the Web site 1630.

The electronic documents of Figs. 18-20 are preferably generated by the tariff server and conveyed back to the Web site 1630 for forwarding to the designated customs office and for inclusion in the package of shipped goods. The recipient receives the packing list and airway bill with the items, and the purchaser receives the invoice. The purchaser receives all of the documents if the items are

-21-

shipped to him, and customs always receives all of these documents. Preferably, the documents are forwarded in an electronic form to the designated customs office for early processing and to minimize any delay in clearing the items through customs. Once cleared, the items can be delivered to the destination without the need for a
5 customs broker or intervention by a local delivery service. Consequently, the invention as embodied in the above-described preferred embodiment enables real-time processing of international electronic commerce transactions and provides an electronic commerce solution which readily can be implemented by a variety of online vendors and international shippers.

10 The present invention can be used in several distinct contexts to facilitate international commerce. The system can be implemented in a business-to-consumer context as described above, wherein an online retailer with access to the tariff server 1610 system provides a value-added service to its customers. The tariff server can also be accessed directly by customers through the Internet to facilitate an
15 international transaction with an online retailer that does not have access to (that is, is not licensed under) the system. Similarly, customer-to-customer international transactions can be facilitated by direct access to the tariff server 1610 from the customer's Web browser 110, as well as business-to-business international transactions.

20 In the various contexts to which the present invention applies, vendors and Customers alike are not restricted to a particular country of origin or a particular shipper for handling. Also, the electronic transmission of shipping documents to the customs offices of the destination countries greatly facilitates the clearance of item purchases to better ensure a favorable shopping experience between vendors and their
25 global customers. The system and method of the present invention shun a overly broad product category classifications (with arbitrarily high tariff rates for most item purchases) and rigid item-description requirements in favor of a more flexible and intelligent methodology for selecting a harmonized code to use and for computing the minimum applicable tariff rate that may be owing for a given international purchase
30 transaction.

-22-

In lieu of searching for a harmonized code, alternative classification schemes can be used with equal advantage provided that the search criterion results in the identification or determination of a minimum tariff rate to apply to an item being purchased.

5 In accordance with a further aspect of the invention, the tariff server 1610 can be implemented in conjunction with the electronic issuance of letters of credit, as is now permitted in some countries such as Turkey and in some states of the United States, without having to go to a bank. An entity desirous of importing one or more items from a foreign country can utilize software such as is available at the tariff 10 server 1610 to identify: the applicable harmonized codes and applicable duties and taxes (in both percentage and amount); the handling fees; and the transportation costs. The total of all costs for importing the item can then be included in a single, electronic letter of credit (e.g., when the terms of the sale are CIF), or can be apportioned among a letter of credit, a credit or debit card and cyber-cash (e.g., when the terms are FOB 15 and the entity wishes to pay the shipper or tariffs by a separate instrument). In this regard, it should be noted that letters of credit are sometimes treated as transferable and divisible even if such terms are not expressly stated in the letter of credit. In addition, the documents generated by the tariff server 1610 (see, e.g., Figs. 18-20) can be included with the electronic letter of credit.

20 Preferably, and in accordance with this further aspect of the invention, upon reporting the tariff due for a particular item purchase, the user can then have a letter of credit issued electronically in an amount up to the total amount of the transaction, or can be charged for the total amount of the transaction with at least a portion being paid for through an electronically issued letter of credit.

25 The present invention provides particular advantages when the item being purchased is a present for a person in a different country. Regardless of whether the present is purchased online or was already purchased, a user can access the tariff server 1610 (or other machine programmed with the software engine described herein) identify the destination country, provide the value of the product to 30 be sent (one of the "purchase transaction details"), and view the applicable

-23-

harmonized codes based on any further descriptive data input by the user concerning the product. As a result, a favorable customs duty, tax amount, transportation rate (for a given shipper), handling fee and the like can be presented to the user as a quote for approval. Upon approving, confirming or electing to have the product shipped using
5 the shipper and service providers identified in the quote, the requisite documents are sent electronically and printed for use by the user in shipping the article to the designated destination country. The software preferably assesses a fee for this service to the user, to one of the service providers that the user has selected, to other service providers that competed in the quote, if any, or a combination of the foregoing.

10 The software of the present invention can be configured to provide access to tax, duties, harmonized tariff schedules as well as statistical and legislative data on import/export policies of local and foreign investments.

15 The foregoing written description is of a preferred embodiment and particular features of the present invention and is not restrictive of the many applications or the breadth of the present invention which is instead defined by the claims appended hereto and substantial equivalents thereof.

-24-

CLAIMS:

- 1 1. A method for facilitating international electronic commerce through a
2 distributed computer network, comprising the steps of:
3 a) obtaining purchase transaction details concerning an item to be
4 purchased;
5 b) selecting a harmonized code for shipping the item to a particular
6 destination by analyzing at least a portion of the purchase transaction
7 details;
8 c) determining a tariff due by applying the selected harmonized code; and
9 d) reporting the tariff due through the distributed computer network.
- 1 2. The method as in claim 1, wherein the selecting step includes searching
2 through a tariff schedule of the particular destination and identifying a
3 harmonized code that best fits item descriptors included in the purchase
4 transaction details.
- 1 3. The method as in claim 1, wherein the selecting step comprises using an
2 artificially intelligent software routine.
- 1 4. The method as in claim 1, including the additional steps of generating an
2 invoice, an airway bill and a packing list from the purchase transaction details
3 and providing same through the distributed computer network.
- 1 5. The method as in claim 1, wherein the purchase transaction details include the
2 cost of the item, the freight for shipping the item to the particular destination,
3 and an item description.
- 1 6. The method as in claim 1, wherein the method steps are performed by a
2 programmed computer connected to the distributed computer network.

-25-

1 7. The method as in claim 6, wherein the method steps are performed in real-
2 time.

1 8. The method as in claim 1, wherein reporting step includes providing the tariff
2 due in the local currency.

1 9. The method as in claim 8, wherein the reporting step further includes
2 providing the tariff due in United States currency.

1 10. A method for facilitating international electronic commerce through a
2 distributed computer network, comprising the steps of:

- 3 a) obtaining purchase transaction details concerning an item to be
4 purchased;
- 5 b) processing the purchase transaction details to thereby select a
6 harmonized code for shipping the item to a prescribed destination at a
7 minimum applicable tariff rate;
- 8 c) determining a tariff due by applying the processed harmonized code;
9 and
- 10 d) reporting the tariff due through the distributed computer network.

1 11. The method as in claim 10, wherein the processing step uses artificially
2 intelligent software.

1 12. The method as in claim 10, wherein the processing step includes searching
2 through a tariff schedule of the particular destination and identifying a
3 harmonized code that best fits item descriptors included in the purchase
4 transaction details.

-26-

-27-

- 1 c) automatically determining a tariff due by applying the selected
2 harmonized code;
- 3 d) providing to the customer a total amount due for the item, the total
4 amount including the tariff due and the cost to the customer; and
5 e) receiving at the server payment of the total amount due.
- 1 20. A software method operating within a programmed machine for determining a
2 tariff due on an item, comprising:
3 a) obtaining details concerning the item;
4 b) selecting a harmonized code for shipping the item to a prescribed
5 destination by analyzing at least a portion of the obtained details;
6 c) determining a tariff due by applying the selected harmonized code; and
7 d) reporting the tariff due.
- 1 21. The software method as in claim 20, wherein the details utilized for selecting
2 the harmonized code are selected from the group consisting of: product name,
3 product description, percentages of ingredients in the product, product group,
4 product category, bar code, machine readable code, product class, and material
5 description.

(54) Title: AUTOMATIC SYSTEMS AND METHODS FOR INCLUDING CUSTOMS TARIFFS IN E-COMMERCE TRANSACTIONS

(57) Abstract: The invention provides systems and methods for facilitating international electronic commerce through a distributed computer network such as the Internet. The method includes the steps of obtaining purchase transaction details (1510) concerning one or more items that are to be purchased, processing at least a portion of the purchase transaction details to select a harmonized code for shipping (1520) the item to a prescribed destination at a minimum applicable tariff rate (1550), determining the tariff due for shipping each such item to a particular destination by applying the selected harmonization code (1560), and reporting the tariff due through the distributed computer network (1568). Preferably, the selection of a harmonized code includes searching through a tariff schedule of the particular destination and identifying a harmonized code that best fits item descriptors included in the purchase transaction details.

COMBINED DECLARATION FOR PATENT APPLICATION AND POWER OF ATTORNEY
 (Includes Reference to PCT International Applications)

ATTORNEY DOCKET NUMBER
 2760/1GO35US1

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed for and which a patent is sought on the invention entitled:

**AUTOMATIC SYSTEMS AND METHODS FOR INCLUDING CUSTOMS TARIFFS IN
 E-COMMERCE TRANSACTIONS**

the specification of which (check only one item below):

- is attached hereto.
 was filed as United States application

Serial No. _____

on _____

and was amended

on _____ (if applicable).

- [X] was filed as PCT international application

Number PCT/US00/07729

on 23 March 2000

and was amended under PCT Article 19

on _____ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate or of any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) of which priority is claimed:

PRIOR FOREIGN/PCT APPLICATION(S) AND ANY PRIORITY CLAIMS UNDER 35 U.S.C. 119:

COUNTRY <small>(If PCT Indicate PCT)</small>	APPLICATION NUMBER	DATE OF FILING <small>(day, month, year)</small>	PRIORITY CLAIMED <small>UNDER 35 U.S.C. 119</small>
